# Contents

1	Introduction	3
2	Permuted Index	5
3	Primitive and Plain $\text{T}_{\text{E}}\text{X}$ commands	95
4	$\text{L}^{\text{A}}\text{T}_{\text{E}}\text{X}$ Commands	107

# Chapter 1

## Introduction

This Index is designed to help  $\text{T}_{\text{E}}\text{X}$  and  $\text{L}^{\text{A}}\text{T}_{\text{E}}\text{X}$  users find the right command among the one thousand-odd commands documented. It is a permuted, or keyword-in-context index. Each command appears under each significant keyword in its definition. For example, `\eject` has the following definition:

**force a page break**

The following two entries appear in the Index, alphabetized by the keywords “page” and “break”:

force a page	break. ....	<code>\eject</code> <sup>P</sup>
force a	page break. ....	<code>\eject</code> <sup>P</sup>

The superscript “P” at the end of the line means this is defined in the plain  $\text{T}_{\text{E}}\text{X}$  macros. The full list is:

*	$\text{T}_{\text{E}}\text{X}$ primitive
(none)	plain $\text{T}_{\text{E}}\text{X}$
L	$\text{L}^{\text{A}}\text{T}_{\text{E}}\text{X}$ command
3	new $\text{T}_{\text{E}}\text{X}$ version 3 command

If a definition is too long to fit on one side of a definition, it is wrapped around. The command definitions appear after the permuted index. There are two sections, one for  $\text{T}_{\text{E}}\text{X}$  primitives and plain  $\text{T}_{\text{E}}\text{X}$ , and the other for  $\text{L}^{\text{A}}\text{T}_{\text{E}}\text{X}$  commands.

There may be some difficulty thinking of the right keyword used in a definition. I have tried to be consistent. Here are a few words I chose (in bold) and some likely synonyms:

**create:** make

**define:** create, initialize, set

**select, construct:** use

**space:** distance, glue, separation

**test:** if

The Proceedings of the summer 1989 T<sub>E</sub>X Users Group meeting contain a description of how this Index was prepared. The Proceedings were published in the *TUGboat* 10, no. 4.

I would like to thank Barbara Beeton, Michael Downes, John Hobby, Howard Trickey, and many others for definitions and suggestions. Doug McIlroy had some helpful suggestions about editing the Index. I'd also like to thank my wife Lorette, who endured my discovery of how much work an index requires.

# Chapter 2

## Chapter 3

# Primitive and Plain T<sub>E</sub>X commands

This is a list of the T<sub>E</sub>X primitives and the Plain T<sub>E</sub>X commands. Primitives are marked with an asterisk. T<sub>E</sub>X version 3 commands are marked with a ‘3’.

* <code>\_</code>	space character.	* <code>\above</code>	fraction with rule thickness.
<code>~</code>	unbreakable space.	* <code>\abovedisplaysshortskip</code>	extra space above displays following short lines.
* <code>\$</code>	enter math mode.	* <code>\abovedisplayskip</code>	extra space above displays.
* <code>\$\$</code>	enter display math mode.	* <code>\abovewithdelims</code>	fraction with specified rule and delimiters.
<code>%</code>	begin comment.	* <code>\accent</code>	put an accent over the next character.
* <code>&amp;</code>	field separator in <code>\halign</code> or <code>\valign</code> .	<code>\active</code>	category code for active characters.
* <code>\_</code>	control space.	<code>\acute</code>	math accent: acute ( $\acute{x}$ ).
<code>\!</code>	math mode negative thin space.	* <code>\adjmerits</code>	demerits for adjacent incompatible lines.
<code>\#</code>	pound, hatch mark, sharp sign, octothorpe (#).	* <code>\advance</code>	perform arithmetic on a register.
<code>\\$</code>	dollar sign.	<code>\advancepageno</code>	advance <code>\pageno</code> by one.
<code>\%</code>	percent sign (%).	<code>\ae</code>	ligature digraph symbol ae ( $\ae$ ).
<code>\&amp;</code>	ampersand.	<code>\AE</code>	ligature digraph symbol capital AE ( $\AE$ ).
<code>\'</code>	acute accent ( $\acute{e}$ ).	* <code>\afterassignment</code>	insert a token after the next assignment command.
<code>\*</code>	math operator: discretionary multiply sign.	* <code>\aftergroup</code>	insert a token after the current group is completed.
<code>\+</code>	begin a tabbed line in an outer environment.	<code>\aleph</code>	math symbol: aleph ( $\aleph$ ).
<code>\,</code>	thin space (math mode).	<code>\allocationnumber</code>	most recently allocated register number.
* <code>\-</code>	discretionary hyphen.	<code>\allowbreak</code>	allow a line break.
<code>\.</code>	dot accent ( $\dot{x}$ ).	<code>\alpha</code>	math Greek letter: alpha ( $\alpha$ ).
* <code>\/</code>	italic correction.	<code>\amalg</code>	math operator: amalgamated sum, co-product ( $\amalg$ ).
<code>\;</code>	thick space (math mode).	<code>\angle</code>	angle symbol ( $\angle$ ).
<code>\=</code>	macron or bar accent ( $\bar{o}$ ).	<code>\approx</code>	math relation: approximately equal ( $\approx$ ).
<code>\&gt;</code>	medium space in math mode.	<code>\arccos</code>	math function: arc cosine.
<code>\{</code>	open brace symbol.	<code>\arcsin</code>	math function: arc sine.
<code>\}</code>	close brace symbol.	<code>\arctan</code>	math function: arc tangent.
<code>\^</code>	circumflex accent ( $\hat{o}$ ).	<code>\arg</code>	math function: arg.
<code>\_</code>	underscore symbol.	<code>\arrowvert</code>	math symbol: vertical bar ( $\left  \right $ ).
<code>\`</code>	grave accent ( $\grave{e}$ ).	<code>\Arrowvert</code>	math symbol: double vertical bar ( $\left\  \right\ $ ).
<code>\ </code>	math symbol: vertical bar ( $\ $ ).	<code>\ast</code>	math operator: asterisk (*).
<code>\~</code>	tilde accent ( $\tilde{n}$ ).		
<code>\"</code>	diæresis or umlaut accent ( $\ddot{x}$ ).		
<code>\aa</code>	symbol å.		
<code>\AA</code>	symbol capital Å.		

<code>\asympt</code>	math relation: asymptote ( $\asymp$ ).	<code>\bigtriangledown</code>	math operator: large down triangle ( $\nabla$ ).
<code>*\atop</code>	fraction without rule.	<code>\bigtriangleup</code>	math operator: large up triangle ( $\triangle$ ).
<code>*\atopwithdelims</code>	fraction without rule with given delimiters.	<code>\biguplus</code>	math operator: large U plus ( $\biguplus$ ).
<code>\b</code>	math accent: bar under ( $\bar{x}$ ).	<code>\bigvee</code>	math join operator: large V ( $\bigvee$ ).
<code>\backslash</code>	math delimiter: backslash ( $\backslash$ ).	<code>\bigwedge</code>	math meet operator: large wedge ( $\bigwedge$ ).
<code>3\badness</code>	badness of a box.	<code>*\binoppenalty</code>	penalty for line break after binary operation.
<code>\bar</code>	math accent: bar ( $\bar{x}$ ).	<code>\bmod</code>	math operator: binary modulo ( $\bmod$ ).
<code>*\baselineskip</code>	normal space between lines.	<code>\bordermatrix</code>	generate a matrix labeled on rows and columns.
<code>*\batchmode</code>	process input without displaying errors.	<code>\bot</code>	math symbol: bottom ( $\perp$ ).
<code>*\begingroup</code>	begin a group.	<code>*\botmark</code>	mark text last encountered on page just boxed.
<code>\beginsection</code>	mark the beginning of a major subdivision.	<code>3\boundarychar</code>	word delimiter character.
<code>*\belowdisplayshortskip</code>	extra space just below displays following short lines.	<code>\bowtie</code>	math relation: bowtie ( $\bowtie$ ).
<code>*\belowdisplayskip</code>	extra space just below displays.	<code>*\box</code>	use a box.
<code>\beta</code>	math Greek letter: beta ( $\beta$ ).	<code>*\boxmaxdepth</code>	maximum depth of boxes on explicit pages.
<code>\bf</code>	select bold extended font.	<code>\brace</code>	fraction without a rule with braces.
<code>\bffam</code>	bold font family.	<code>\braceleft</code>	lower left piece of a horizontal brace.
<code>\bgroup</code>	begin a group.	<code>\bracketl</code>	upper left piece of a horizontal brace.
<code>\big</code>	1-line math delimiter size.	<code>\bracerd</code>	lower right piece of a horizontal brace.
<code>\Big</code>	1.5-line math delimiter size.	<code>\braceru</code>	upper right piece of a horizontal brace.
<code>\bigbreak</code>	large vertical space or a good page break.	<code>\bracevert</code>	piece of a vertical brace ( $\left  \right $ ).
<code>\bigcap</code>	math operator: large cap ( $\bigcap$ ).	<code>\brack</code>	fraction without a rule with brackets.
<code>\bigcirc</code>	math operator: large circle ( $\bigcirc$ ).	<code>\break</code>	force a line break.
<code>\bigcup</code>	math operator: large cup ( $\bigcup$ ).	<code>\breve</code>	math accent: breve ( $\breve{x}$ ).
<code>\bigg</code>	2-line math delimiter size.	<code>*\brokenpenalty</code>	penalty if page break after hyphenated line.
<code>\Bigg</code>	2.5-line math delimiter size.	<code>\buildrel</code>	put symbols over math relations.
<code>\biggl</code>	2-line left math delimiter.	<code>\bullet</code>	math operator: bullet ( $\bullet$ ).
<code>\Biggl</code>	2.5-line left math delimiter.	<code>\bye</code>	finish processing input.
<code>\biggm</code>	2-line middle math delimiter.	<code>\c</code>	cedilla accent ( $\c$ ).
<code>\Biggm</code>	2.5-line middle math delimiter.	<code>\cal</code>	math mode calligraphic letters font.
<code>\biggr</code>	2-line right math delimiter.	<code>\cap</code>	math operator: intersection or cap ( $\cap$ ).
<code>\Biggr</code>	2.5-line right math delimiter.	<code>\cases</code>	generate a matrix with a left brace delimiter.
<code>\bigl</code>	1-line left math delimiter.	<code>*\catcode</code>	set a character's processing category type.
<code>\Bigl</code>	1.5-line left math delimiter.	<code>\cdot</code>	math operator: centered dot ( $\cdot$ ).
<code>\bigm</code>	1-line middle math delimiter.	<code>\cdotp</code>	centered dot with special spacing in math mode.
<code>\Bigm</code>	1.5-line middle math delimiter.	<code>\cdots</code>	three centered dots in math mode ( $\cdots$ ).
<code>\bigodot</code>	math operator: large circle with dot ( $\odot$ ).	<code>\centering</code>	internal Plain T <sub>E</sub> X space used for centering.
<code>\bigoplus</code>	math operator: large circle with plus ( $\oplus$ ).	<code>\centerline</code>	center text in a line.
<code>\bigotimes</code>	math operator: large circle with times ( $\otimes$ ).		
<code>\bigr</code>	1-line right math delimiter.		
<code>\Bigr</code>	1.5-line right math delimiter.		
<code>\bigskip</code>	large vertical break.		
<code>\bigskipamount</code>	<code>\bigskip</code> space.		
<code>\bigsqcup</code>	math operator: large square cup ( $\bigsqcup$ ).		

<code>*\char</code>	specify a character by its numeric code.	<code>*\delcode</code>	define a character as a delimiter.
<code>*\chardef</code>	define a name for a character.	<code>*\delimiter</code>	define a delimiter for math mode.
<code>\check</code>	math accent: check ( $\check{x}$ ).	<code>*\delimiterfactor</code>	ratio for variable delimiters times 1000.
<code>\chi</code>	math Greek letter: chi ( $\chi$ ).	<code>*\delimitershortfall</code>	amount by which delimiters can fail to span included material.
<code>\choose</code>	fraction without a rule with parentheses.	<code>\delta</code>	math Greek letter: delta ( $\delta$ ).
<code>\circ</code>	math operator: circle ( $\circ$ ).	<code>\Delta</code>	math Greek letter: capital delta ( $\Delta$ ).
<code>*\cleaders</code>	surround a space with a repeated box or rule.	<code>\det</code>	math function: det.
<code>\cleartabs</code>	reset tabs.	<code>\diamond</code>	math operator: diamond ( $\diamond$ ).
<code>*\closein</code>	close an input file.	<code>\diamondsuit</code>	math symbol: diamond suit ( $\diamondsuit$ ).
<code>*\closeout</code>	close an output file.	<code>\dim</code>	math function: dim.
<code>*\clubpenalty</code>	penalty if page break after first line of paragraph.	<code>*\dimen</code>	use a dimension register.
<code>\clubsuit</code>	math symbol: club suit ( $\clubsuit$ ).	<code>*\dimendef</code>	define a name for a dimension register.
<code>\colon</code>	colon in a math formula.	<code>*\discretionary</code>	append a discretionary item to the current list.
<code>\columns</code>	end a <code>\settabs</code> definition.	<code>*\displayindent</code>	indentation of line for displayed equation.
<code>\cong</code>	math relation: congruent ( $\cong$ ).	<code>*\displaylimits</code>	restore default limit placement on large math operators.
<code>\coprod</code>	math operator: large co-product ( $\coprod$ ).	<code>\displaylines</code>	display a stack of formulas without alignment.
<code>*\copy</code>	use a copy of a box.	<code>*\displaystyle</code>	use normal math script style.
<code>\copyright</code>	copyright symbol ( $\copyright$ ).	<code>*\displaywidowpenalty</code>	penalty for creating a widow line before a display.
<code>\cos</code>	math function: cosine.	<code>*\displaywidth</code>	width of a displayed equation.
<code>\cosh</code>	math function: hyperbolic cosine.	<code>\div</code>	math operator: div.
<code>\cot</code>	math function: cotangent.	<code>*\divide</code>	divide a register by a value.
<code>\coth</code>	math function: hyperbolic cotangent.	<code>\do</code>	redefinable scratch control sequence used by <code>\dospecials</code> .
<code>*\count</code>	use a count register.	<code>\dospecials</code>	change the character code for a set of special characters.
<code>*\countdef</code>	define a name for a count register.	<code>\dosupereject</code>	flush insertions and eject to a new page.
<code>*\cr</code>	end a line in <code>\halign</code> aligned text.	<code>\dot</code>	math accent: dot ( $\dot{x}$ ).
<code>*\crcr</code>	ensure a <code>\cr</code> in <code>\halign</code> .	<code>\doteq</code>	math relation: dotted equal ( $\doteq$ ).
<code>\csc</code>	math function: cosecant.	<code>\dotfill</code>	fill a space with dots.
<code>*\csname</code>	begin expanding tokens to construct a command name.	<code>\dots</code>	an ellipsis, equivalent to <code>\ldots</code> in math mode.
<code>\cup</code>	math operator: union or cup ( $\cup$ ).	<code>*\doublehyphendemerits</code>	demerits for consecutive broken lines.
<code>\d</code>	dot under accent ( $\dot{x}$ ).	<code>\downarrow</code>	math symbol: down arrow ( $\downarrow$ ).
<code>\dag</code>	dagger symbol ( $\dagger$ ).	<code>\Downarrow</code>	math symbol: downward double arrow ( $\Downarrow$ ).
<code>\dagger</code>	math operator: dagger ( $\dagger$ ).	<code>\downbracefill</code>	fill a space with a downward brace.
<code>\dashv</code>	math relation: dash V ( $\dashv$ ).	<code>*\dp</code>	depth of a box.
<code>*\day</code>	current day of the month.	<code>*\dump</code>	terminate $\TeX$ and write a format file: INITEX only.
<code>\ddag</code>	double dagger symbol ( $\ddagger$ ).	<code>*\edef</code>	define a macro with expanded replacement text.
<code>\ddagger</code>	math operator: double dagger ( $\ddagger$ ).	<code>\egroup</code>	end a group.
<code>\ddot</code>	math accent: double dot ( $\ddot{x}$ ).		
<code>\ddots</code>	three diagonal dots in math mode ( $\ddots$ ).		
<code>*\deadcycles</code>	number of output routine calls since last <code>\shipout</code> .		
<code>*\def</code>	define a macro.		
<code>*\defaultthyphenchar</code>	default hyphen when a font is loaded.		
<code>*\defaultskewchar</code>	default horizontal kern character to position accents.		
<code>\deg</code>	math function: degree of a polynomial ( $\deg$ ).		

<code>\eject</code>	force a page break.	<code>*\expandafter</code>	expand the token following the next token.
<code>\ell</code>	math symbol: small script L ( $\ell$ ).	<code>*\fam</code>	current family number.
<code>*\else</code>	alternative to an <code>\if</code> .	<code>*\fi</code>	end of an <code>\if</code> clause.
<code>3\emergencystretch</code>	extra space in badly-stretched lines.	<code>\filbreak</code>	break a page unless there is a better <code>\filbreak</code> below.
<code>\empty</code>	an empty list of tokens.	<code>*\finalhyphendemerits</code>	demerits for a penultimate broken line.
<code>\emptyset</code>	math symbol: empty set ( $\emptyset$ ).	<code>*\firstmark</code>	mark text first encountered on page just boxed.
<code>*\end</code>	terminate T <sub>E</sub> X.	<code>\fivebf</code>	5 point boldface Roman font.
<code>*\endcsname</code>	terminate a <code>\csname</code> token list.	<code>\fivei</code>	5 point math italic font.
<code>\endgraf</code>	equivalent to <code>\par</code> .	<code>\fiverm</code>	5 point Roman font.
<code>*\endgroup</code>	end a group.	<code>\fivesy</code>	5 point math symbol font.
<code>*\endinput</code>	stop reading current input file at the end of the current line.	<code>\flat</code>	math symbol: flat ( $\flat$ ).
<code>\endinsert</code>	end of an insert.	<code>*\floatingpenalty</code>	penalty for insertions that are split.
<code>\endline</code>	equivalent to <code>\cr</code> , end of aligned text.	<code>\fmtname</code>	name of current T <sub>E</sub> X format package.
<code>*\endlinechar</code>	character placed at the right end of an input line.	<code>\fmtversion</code>	version of current T <sub>E</sub> X format package.
<code>\enskip</code>	breakable small horizontal skip.	<code>\folio</code>	typeset page number.
<code>\enspace</code>	unbreakable small horizontal space.	<code>*\font</code>	load a font.
<code>\epsilon</code>	math Greek letter: epsilon ( $\epsilon$ ).	<code>*\fontdimen</code>	set a font-related parameter.
<code>\eqalign</code>	align a stack of equations.	<code>*\fontname</code>	gives the external file name for the given font.
<code>\eqalignno</code>	align a stack of equations with equation numbers.	<code>\footins</code>	insertion class for footnote inserts.
<code>*\eqno</code>	equation number.	<code>\footline</code>	page foot line.
<code>\equiv</code>	math relation: equivalence ( $\equiv$ ).	<code>\footnote</code>	create a footnote.
<code>*\errhelp</code>	help message to display if user asks for help.	<code>\footnoterule</code>	define the rule separating a page and footnotes.
<code>*\errmessage</code>	write balanced error message to the terminal.	<code>\footstrut</code>	ensure footnote line separation.
<code>3\errorcontextlines</code>	number of lines of context to be displayed in an error message.	<code>\forall</code>	math symbol: for-all quantifier ( $\forall$ ).
<code>*\errorstopmode</code>	pause for normal errors while processing T <sub>E</sub> X input.	<code>\frenchspacing</code>	suppress special spacing after punctuation.
<code>*\escapechar</code>	escape character in the output of control sequence tokens.	<code>\frown</code>	math relation: frown ( $\frown$ ).
<code>\eta</code>	math Greek letter: eta ( $\eta$ ).	<code>*\futurelet</code>	assigns the second token to a control sequence and continues.
<code>*\everycr</code>	tokens to insert after every <code>\cr</code> or nonredundant <code>\crr</code> .	<code>\gamma</code>	math Greek letter: gamma ( $\gamma$ ).
<code>*\everydisplay</code>	tokens to insert when display math begins.	<code>\Gamma</code>	math Greek letter: capital gamma ( $\Gamma$ ).
<code>*\everyhbox</code>	tokens to insert when an hbox begins.	<code>\gcd</code>	math function: gcd.
<code>*\everyjob</code>	tokens to insert when the job begins.	<code>*\gdef</code>	define a macro globally.
<code>*\everymath</code>	tokens to insert when math in text begins.	<code>\ge</code>	math relation: greater or equal ( $\geq$ ).
<code>*\everypar</code>	tokens to insert when a paragraph begins.	<code>\geq</code>	math relation: greater or equal ( $\geq$ ).
<code>*\everyvbox</code>	tokens to insert when a vbox begins.	<code>\gets</code>	math relation: gets ( $\leftarrow$ ).
<code>*\exhyphenpenalty</code>	penalty for line break after explicit hyphen.	<code>\gg</code>	math relation: much greater ( $\gg$ ).
<code>\exists</code>	math symbol: exists quantifier ( $\exists$ ).	<code>*\global</code>	the following macro definition or register setting is global.
<code>\exp</code>	math function: exp.	<code>*\globaldefs</code>	override <code>\global</code> specifications.
		<code>\goodbreak</code>	good page break.
		<code>\grave</code>	math accent: grave ( $\grave{\cdot}$ ).
		<code>\H</code>	long Hungarian umlaut accent ( $\ddot{\cdot}$ ).
		<code>*\halign</code>	create an aligned table.

<code>\hang</code>	indent second and subsequent lines in a paragraph by <code>\parindent</code> .	<code>*\ifeof</code>	test for end of file.
<code>*\hangafter</code>	hanging indentation changes after specified number of lines.	<code>\iff</code>	math relation: if and only if ( $\iff$ ).
<code>*\hangindent</code>	set hanging indentation.	<code>*\iffalse</code>	test always false.
<code>\hat</code>	math accent: hat ( $\hat{x}$ ).	<code>*\ifhbox</code>	test for a horizontal box.
<code>*\hbadness</code>	limit for bad hbox errors.	<code>*\ifhmode</code>	test for horizontal mode.
<code>\hbar</code>	math symbol: Planck's constant or h-bar ( $\hbar$ ).	<code>*\ifinner</code>	test for an internal mode.
<code>*\hbox</code>	create a box with horizontal mode material.	<code>*\ifmmode</code>	test for math mode.
<code>\headline</code>	page head line.	<code>*\ifnum</code>	test two integers.
<code>\heartsuit</code>	math symbol: heart suit ( $\heartsuit$ ).	<code>*\ifodd</code>	test for odd integer.
<code>*\hfil</code>	infinitely stretchable horizontal space.	<code>*\iftrue</code>	test always succeeds.
<code>*\hfill</code>	more infinitely stretchable horizontal space.	<code>*\ifvbox</code>	test for a vertical box.
<code>*\hfilneg</code>	cancel infinitely stretchable horizontal space.	<code>*\ifvmode</code>	test for vertical mode.
<code>*\hfuzz</code>	maximum overrun before overfull hbox messages occur.	<code>*\ifvoid</code>	test for an empty box.
<code>\hglue</code>	create some horizontal space.	<code>*\ifx</code>	compare tokens.
<code>\hideskip</code>	special Plain TeX space used in alignment.	<code>*\ignorespaces</code>	read, expand, then ignore tokens until a non-space is found.
<code>\hidewidth</code>	permit an alignment entry to stick out of its column.	<code>\Im</code>	math symbol: imaginary, Fraktur I ( $\Im$ ).
<code>*\hoffset</code>	horizontal offset of a page.	<code>\imath</code>	math symbol: dotless i ( $i$ ).
<code>\hom</code>	math function: hom.	<code>*\immediate</code>	perform a <code>\read</code> or <code>\write</code> immediately.
<code>\hookleftarrow</code>	math symbol: hook left arrow ( $\hookleftarrow$ ).	<code>\in</code>	math relation: in ( $\in$ ).
<code>\hookrightarrow</code>	math symbol: hook right arrow ( $\hookrightarrow$ ).	<code>*\indent</code>	start a paragraph indented <code>\parindent</code> .
<code>\hphantom</code>	create a zero-height hbox with the width of a formula.	<code>\inf</code>	math function: inf.
<code>*\hrule</code>	produce a horizontal rule.	<code>\infty</code>	math symbol: infinity ( $\infty$ ).
<code>\hrulefill</code>	fill a space with a rule.	<code>*\input</code>	read a file.
<code>*\hsize</code>	width of a paragraph or <code>\hbox</code> .	<code>*\insert</code>	define where text will be inserted when the page is formatted.
<code>*\hskip</code>	add horizontal space.	<code>*\insertpenalties</code>	sum of penalties for split insertions on the page.
<code>*\hss</code>	infinitely stretchable and shrinkable horizontal space.	<code>\int</code>	math operator: integral ( $\int$ ).
<code>*\ht</code>	height of a box.	<code>\interdisplaylinepenalty</code>	penalty for breaking between lines of a display.
<code>*\hyphenation</code>	insert words into hyphenation dictionary.	<code>\interfootnotelinepenalty</code>	penalty for breaking between lines of a footnote.
<code>*\hyphenchar</code>	hyphenation character for this font.	<code>*\interlinepenalty</code>	additional penalty for page break between lines.
<code>*\hyphenpenalty</code>	penalty for line break after discretionary hyphen.	<code>\iota</code>	math symbol: iota ( $\iota$ ).
<code>\i</code>	dotless i letter ( $i$ ).	<code>\it</code>	select italic font.
<code>\ialign</code>	start an <code>\halign</code> with <code>\tabskip</code> initialized to zero.	<code>\item</code>	display an item.
<code>*\if</code>	compare two character codes.	<code>\itemitem</code>	display a sub-item.
<code>*\ifcase</code>	select one of several entries determined by an integer.	<code>\itfam</code>	italic font family.
<code>*\ifcat</code>	test category codes.	<code>\j</code>	dotless j letter ( $j$ ).
<code>*\ifdim</code>	test two dimensions.	<code>\jmath</code>	math symbol: dotless j ( $j$ ).
		<code>*\jobname</code>	name of the principal input file.
		<code>\joinrel</code>	internal Plain TeX command to piece together long arrows.
		<code>\jot</code>	unit of measure for opening up displays.
		<code>\kappa</code>	math Greek letter: kappa ( $\kappa$ ).
		<code>\ker</code>	math function: ker.

<code>*\kern</code>	kern a given distance.	<code>\lfloor</code>	math delimiter: left floor bracket ( $\lfloor$ ).
<code>\l</code>	Polish letter: slashed L ( $\l$ ).	<code>\lg</code>	math function: lg.
<code>\L</code>	Polish letter: upper-case slashed L ( $\L$ ).	<code>\lgroup</code>	math delimiter: left group ( $\lgroup$ ).
<code>\lambda</code>	math Greek letter: lambda ( $\lambda$ ).	<code>\lhook</code>	math symbol: left hook ( $\lhook$ ).
<code>\Lambda</code>	math Greek letter: capital lambda ( $\Lambda$ ).	<code>\lim</code>	math function: lim.
<code>\land</code>	math operator: logical and ( $\wedge$ ).	<code>\liminf</code>	math function: limit infimum ( $\liminf$ ).
<code>\langle</code>	math delimiter: left angle bracket ( $\langle$ ).	<code>*\limits</code>	place math limits above and below math operators.
<code><sup>3</sup>\language</code>	current language used for hyphenation.	<code>\limsup</code>	math function: limit supremum ( $\limsup$ ).
<code>*\lastbox</code>	fetch last box off the current list.	<code>\line</code>	create a box of current line width.
<code>*\lastkern</code>	fetch last kern off the current list.	<code>*\linepenalty</code>	amount added to badness of every line in a paragraph.
<code>*\lastpenalty</code>	fetch last penalty off the current list.	<code>*\lineskip</code>	extra space between lines if <code>\baselineskip</code> isn't enough.
<code>*\lastskip</code>	fetch last skip off the current list.	<code>*\lineskiplimit</code>	minimum space between lines in a vertical list.
<code>\lbrace</code>	math delimiter: left curly brace ( $\lbrace$ ).	<code>\ll</code>	math relation: much less ( $\ll$ ).
<code>\lbrack</code>	math delimiter: left bracket ( $\lbrack$ ).	<code>\llap</code>	create a zero-width box with text to the left.
<code>*\lccode</code>	lower-case code for a character.	<code>\lmoustache</code>	math symbol: left moustache ( $\lrcorner$ ).
<code>\lceil</code>	math delimiter: left ceiling bracket ( $\lceil$ ).	<code>\ln</code>	math function: ln.
<code>\ldotp</code>	lower dot math symbol with special spacing.	<code>\lnot</code>	math operator: logical not, hook ( $\lnot$ ).
<code>\ldots</code>	three low dots in math mode ( $\dots$ ).	<code>\log</code>	math function: log.
<code>\le</code>	math relation: less or equal ( $\leq$ ).	<code>*\long</code>	the following macro may have multiple paragraphs as parameters.
<code>*\leaders</code>	fill a space with a repeated box or rule.	<code>\longleftarrow</code>	math symbol: long left arrow ( $\longleftarrow$ ).
<code>\leavevmode</code>	switch to horizontal mode from vertical mode.	<code>\Longleftarrow</code>	math symbol: long left double arrow ( $\Longleftarrow$ ).
<code>*\left</code>	begin a new math list with a left delimiter.	<code>\longlefttrightarrow</code>	math symbol: long left and right arrow ( $\longleftrightarrow$ ).
<code>\leftarrow</code>	math symbol: left arrow ( $\leftarrow$ ).	<code>\Longlefttrightarrow</code>	math symbol: long left-right double arrow ( $\Longleftrightarrow$ ).
<code>\Leftarrow</code>	math symbol: left double arrow ( $\Leftarrow$ ).	<code>\longmapsto</code>	math symbol: long maps to ( $\longmapsto$ ).
<code>\leftarrowfill</code>	fill a space with a left arrow.	<code>\longrightarrow</code>	math symbol: long right arrow ( $\longrightarrow$ ).
<code>\leftharpoondown</code>	math symbol: left harpoon down ( $\leftharpoondown$ ).	<code>\Longrightarrow</code>	math symbol: long right double arrow ( $\Longrightarrow$ ).
<code>\leftharpoonup</code>	math symbol: left harpoon up ( $\leftharpoonup$ ).	<code>\loop</code>	begin a loop.
<code><sup>3</sup>\lefthyphenposition</code>	minimum number of characters before hyphenation at the start of a word.	<code>*\looseness</code>	force a change to the number of lines in a paragraph.
<code>\leftline</code>	flush text left on a line.	<code>\lor</code>	math symbol: logical or ( $\vee$ ).
<code>\leftrightarrow</code>	math symbol: left-right arrow ( $\leftrightarrow$ ).	<code>*\lower</code>	lower a box a given distance.
<code>\Leftrightarrow</code>	math symbol: left-right double arrow ( $\Leftrightarrow$ ).	<code>*\lowercase</code>	translate balanced text to lower-case.
<code>*\leftskip</code>	space to the left of a paragraph.	<code>\lq</code>	math symbol: left quote ( $\lq$ ).
<code>\leq</code>	math relation: less or equal ( $\leq$ ).	<code>*\mag</code>	magnification ratio times 1000.
<code>\leqalignno</code>	align a stack of equations with left equation numbers.	<code>\magnification</code>	set the magnification for the document.
<code>*\leqno</code>	left equation number.	<code>\magstep</code>	define font magnification.
<code>*\let</code>	define a synonym for the current meaning of a control sequence.		

<code>\magstephalf</code>	use 11 point magnification.	<code>\min</code>	math function: min.
<code>\makefootline</code>	constructs a box with the page foot.	<code>\mit</code>	math mode italic font.
<code>\makeheadline</code>	constructs a box with the page header.	<code>*\mkern</code>	kern in math mode.
<code>\mapsto</code>	math symbol: maps to ( $\mapsto$ ).	<code>\models</code>	math relation: models ( $\models$ ).
<code>\mapstochar</code>	math symbol: maps to char ( $\mapstochar$ ).	<code>*\month</code>	current month of the year.
<code>*\mark</code>	place balanced text into a mark item on the current list.	<code>*\moveleft</code>	add a box to the vertical list shifted left.
<code>*\mathaccent</code>	place an accent over the next math field.	<code>*\moveright</code>	add a box to the vertical list shifted right.
<code>*\mathbin</code>	define a binary math operator.	<code>\mp</code>	math operator: minus plus ( $\mp$ ).
<code>*\mathchar</code>	specify a math character code.	<code>*\mskip</code>	insert horizontal space in math mode.
<code>*\mathchardef</code>	define a name for a math character.	<code>\mu</code>	math Greek letter: mu ( $\mu$ ).
<code>*\mathchoice</code>	choose a math formula based on the current style.	<code>*\multiply</code>	multiply a register by a value.
<code>*\mathclose</code>	select math spacing of a closing delimiter for the next item.	<code>\multispan</code>	span several columns in an alignment.
<code>*\mathcode</code>	set a math character's processing category type.	<code>*\muskip</code>	math skip register.
<code>\mathhexbox</code>	internal Plain T <sub>E</sub> X operation to define math text symbols.	<code>*\muskipdef</code>	define a name for a math skip register.
<code>*\mathinner</code>	define an inner math subformula.	<code>\nabla</code>	math symbol: nabla ( $\nabla$ ).
<code>*\mathop</code>	define a large math operator.	<code>\narrower</code>	increase left and right margins by <code>\parindent</code> .
<code>*\mathopen</code>	select math spacing of an opening delimiter for the next item.	<code>\natural</code>	math symbol: natural ( $\natural$ ).
<code>*\mathord</code>	define an ordinary math operator.	<code>\ne</code>	math relation: not equal ( $\neq$ ).
<code>\mathpalette</code>	define a symbol that will work properly in text and script sizes.	<code>\nearrow</code>	math symbol: northeast arrow ( $\nearrow$ ).
<code>*\mathpunct</code>	define a math punctuation operator.	<code>\neg</code>	math operator: negate ( $\neg$ ).
<code>*\mathrel</code>	define a math relation operator.	<code>\negthinspace</code>	unbreakable tiny negative math mode horizontal space.
<code>\mathstrut</code>	math strut with height and depth of parentheses.	<code>\neq</code>	math relation: not equal ( $\neq$ ).
<code>*\mathsurround</code>	define kerning around math in text.	<code>\newbox</code>	allocate a new box register.
<code>\matrix</code>	generate a matrix without delimiters.	<code>\newcount</code>	allocate a new count register.
<code>\max</code>	math function: max.	<code>\newdimen</code>	allocate a new dimension register.
<code>*\maxdeadcycles</code>	upper bound on output routine calls.	<code>\newfam</code>	define a new font family.
<code>*\maxdepth</code>	maximum depth of boxes on main pages.	<code>\newhelp</code>	define a new help message.
<code>\maxdimen</code>	largest permissible dimension.	<code>\newif</code>	define a new <code>\if</code> command.
<code>*\meaning</code>	give a token list defining the semantics of a token.	<code>\newinsert</code>	allocate a new insert register.
<code>\medbreak</code>	medium vertical space or a good page break.	<code>3\newlanguage</code>	define a new language to be used for hyphenation.
<code>*\medmuskip</code>	medium space in math formulas.	<code>*\newlinechar</code>	character that starts a new output line in a write statement.
<code>\medskip</code>	medium vertical space.	<code>\newmuskip</code>	allocate a new math skip register.
<code>\medskipamount</code>	<code>\medskip</code> space.	<code>\newread</code>	allocate a new input file.
<code>*\message</code>	write balanced text to terminal.	<code>\newskip</code>	allocate a new skip register.
<code>\mid</code>	math relation: mid ( $\mid$ ).	<code>\newtoks</code>	allocate a new token register.
<code>\midinsert</code>	insert at current position in page.	<code>\newwrite</code>	allocate a new output file.
		<code>\ni</code>	math relation: contains ( $\ni$ ).
		<code>*\noalign</code>	insert unaligned material in <code>\halign</code> or <code>\valign</code> .
		<code>\nobreak</code>	prohibit a line or page break.
		<code>*\noexpand</code>	suppress expansion of a character.
		<code>*\noindent</code>	start a paragraph without indentation.
		<code>\nointerlineskip</code>	suppress interline space before next vertical box.

<code>*\nolimits</code>	place superscripts and subscripts after math operators.	<code>\otimes</code>	math operator: tensor product, circle times ( $\otimes$ ).
<code>\nonfrenchspacing</code>	enable special spacing after punctuation.	<code>*\outer</code>	the following macro must not be called from another macro.
<code>*\nonscript</code>	suppress space in script and small script styles.	<code>*\output</code>	define the page output routine.
<code>*\nonstopmode</code>	process input without stopping for errors.	<code>*\outputpenalty</code>	penalty at the current page break.
<code>\nopagenumbers</code>	suppress page numbers.	<code>*\over</code>	fraction with a rule.
<code>\normalbaselines</code>	set line spacing to normal values.	<code>\overbrace</code>	horizontal brace over a math formula.
<code>\normalbaselineskip</code>	normal <code>\baselineskip</code> .	<code>*\overfullrule</code>	width of rules appended to overfull boxes.
<code>\normalbottom</code>	justify page bottoms to the same height.	<code>\overleftarrow</code>	left arrow over a math formula.
<code>\normallineskip</code>	value of normal <code>\lineskip</code> .	<code>*\overline</code>	draw a line over a formula.
<code>\normallineskiplimit</code>	value of normal <code>\lineskiplimit</code> .	<code>\overrightarrow</code>	right arrow over a math formula.
<code>\not</code>	math operator: not ( $/$ ).	<code>*\overwithdelims</code>	fraction with rule and given delimiters.
<code>\not=</code>	math relation: not equal ( $\neq$ ).	<code>\owns</code>	math relation: owns ( $\ni$ ).
<code>\notin</code>	math operator: not in ( $\notin$ ).	<code>\P</code>	math symbol: paragraph ( $\P$ ).
<code>\nu</code>	math Greek letter: nu ( $\nu$ ).	<code>\pagebody</code>	put page contents in a box of the proper height.
<code>\null</code>	an empty hbox.	<code>\pagecontents</code>	produce a vertical list of the body of a page.
<code>*\nulldelimiterspace</code>	width of a null delimiter.	<code>*\pagedepth</code>	depth of the current page.
<code>*\nullfont</code>	a font with no characters.	<code>*\pagefilllstretch</code>	amount of fill space in current page.
<code>*\number</code>	convert a number to a token string.	<code>*\pagefillstretch</code>	amount of fill space in current page.
<code>\nwarrow</code>	math symbol: northwest arrow ( $\nwarrow$ ).	<code>*\pagefilstretch</code>	amount of fil space in current page.
<code>\o</code>	Norwegian letter: o with slash ( $\oslash$ ).	<code>*\pagegoal</code>	desired page height.
<code>\O</code>	Norwegian letter: capital o with slash ( $\O$ ).	<code>\pageinsert</code>	insert a whole page.
<code>\obeylines</code>	verbatim line breaks in input text.	<code>\pageno</code>	current page number.
<code>\obeyspaces</code>	verbatim spaces in input text.	<code>*\pageshrink</code>	amount of glue shrinkage in current page.
<code>\odot</code>	math operator: circle dot ( $\odot$ ).	<code>*\pagestretch</code>	amount of glue stretch in current page.
<code>\oe</code>	ligature digraph symbol oe ( $\oe$ ).	<code>*\pagetotal</code>	natural height of page so far.
<code>\OE</code>	ligature digraph symbol capital OE ( $\OE$ ).	<code>*\par</code>	end a paragraph.
<code>\offinterlineskip</code>	turn off extra space between lines.	<code>\parallel</code>	math relation: parallel ( $\parallel$ ).
<code>\oint</code>	math operator: contour integral ( $\oint$ ).	<code>*\parfillskip</code>	space at the end of the last line of a paragraph.
<code>\oldstyle</code>	select old-style numerals with descenders.	<code>*\parindent</code>	define paragraph indentation.
<code>\omega</code>	math Greek letter: omega ( $\omega$ ).	<code>*\parshape</code>	define an unusual paragraph shape.
<code>\Omega</code>	math Greek letter: capital omega ( $\Omega$ ).	<code>*\parskip</code>	define space between paragraphs.
<code>\ominus</code>	math operator: circle minus ( $\ominus$ ).	<code>\partial</code>	math symbol: partial ( $\partial$ ).
<code>*\omit</code>	suppress the template in the alignment preamble for this entry.	<code>*\patterns</code>	define a set of hyphenation patterns.
<code>*\openin</code>	open a file for input.	<code>*\pausing</code>	pause after each line is read from a file.
<code>*\openout</code>	open a file for output.	<code>*\penalty</code>	specify penalty for a line or page break.
<code>\openup</code>	increase line separation in math mode.	<code>\perp</code>	math relation: perpendicular ( $\perp$ ).
<code>\oplus</code>	math operator: direct sum, circle plus ( $\oplus$ ).		
<code>*\or</code>	separate cases in an <code>\ifcase</code> .		
<code>\oslash</code>	math operator: circle slash ( $\oslash$ ).		

<code>\phantom</code>	use the space taken by a formula.	<code>*\relpenalty</code>	penalty for line break after math relation.
<code>\phi</code>	math Greek letter: phi ( $\phi$ ).	<code>\removeat</code>	remove last skip on the list.
<code>\Phi</code>	math Greek letter: capital phi ( $\Phi$ ).	<code>\repeat</code>	end of a <code>\loop</code> body.
<code>\pi</code>	math Greek letter: pi ( $\pi$ ).	<code>\rfloor</code>	math delimiter: right floor ( $\rfloor$ ).
<code>\Pi</code>	math Greek letter: capital pi ( $\Pi$ ).	<code>\rgroup</code>	math delimiter: right group ( $\rgroup$ ).
<code>\plainoutput</code>	default Plain output routine.	<code>\rho</code>	math Greek letter: rho ( $\rho$ ).
<code>\pm</code>	math operator: plus or minus ( $\pm$ ).	<code>\rhook</code>	math symbol: right hook ( $\rhook$ ).
<code>\pmatrix</code>	generate a matrix with parentheses delimiters.	<code>*\right</code>	end a math list with a right delimiter.
<code>\pmod</code>	math function: mod within parentheses ( $\pmod$ ).	<code>\rightarrow</code>	math symbol: right arrow ( $\rightarrow$ ).
<code>*\postdisplaypenalty</code>	penalty for page break just after a display.	<code>\Rightarrow</code>	math symbol: right double arrow ( $\Rightarrow$ ).
<code>\Pr</code>	math function: probability (Pr).	<code>\rightarrowfill</code>	fill a space with a right arrow.
<code>\prec</code>	math relation: precedes ( $\prec$ ).	<code>\rightharpoondown</code>	math symbol: right harpoon down ( $\rightharpoondown$ ).
<code>\preceq</code>	math relation: precedes or equal ( $\preceq$ ).	<code>\rightharpoonup</code>	math symbol: right harpoon up ( $\rightharpoonup$ ).
<code>*\predisplaypenalty</code>	penalty for page break just before a display.	<code>3\rightshyphenposition</code>	minimum number of characters after hyphenation at the end of a word.
<code>*\predisplaysize</code>	length of text preceding a display.	<code>\rightleftharpoons</code>	math symbol: right left harpoon ( $\rightleftharpoons$ ).
<code>\preloaded</code>	scratch control sequence used in preloading fonts.	<code>\rightline</code>	flush right text on a line.
<code>*\pretolerance</code>	badness tolerance before hyphenation is attempted.	<code>*\rightskip</code>	space to the right of a paragraph.
<code>*\prevdepth</code>	depth of the last box on the vertical list.	<code>\rlap</code>	create a zero-width box with text to the right.
<code>*\prevgraf</code>	number of lines in the last paragraph.	<code>\rm</code>	select Roman font.
<code>\prime</code>	math symbol: prime ( $x'$ ).	<code>\rmoustache</code>	math symbol: right moustache ( $\rmoustache$ ).
<code>\proclaim</code>	begin theorem with special format in math environment.	<code>*\romannumeral</code>	convert a number to lower-case Roman numerals.
<code>\prod</code>	math operator: large product ( $\prod$ ).	<code>\root</code>	specified root of a formula.
<code>\propto</code>	math relation: proportional to ( $\propto$ ).	<code>\rq</code>	right quote ( $\rq$ ).
<code>\psi</code>	math Greek letter: psi ( $\psi$ ).	<code>\S</code>	math symbol: section ( $\S$ ).
<code>\Psi</code>	math Greek letter: capital psi ( $\Psi$ ).	<code>\sb</code>	subscript, equivalent to <code>_</code> .
<code>\quad</code>	large breakable horizontal skip.	<code>*\scriptfont</code>	select font for small math scripts.
<code>\quad</code>	breakable medium horizontal skip.	<code>*\scriptscriptfont</code>	select font for very small math scripts.
<code>*\radical</code>	put a math field under a radical.	<code>*\scriptscriptstyle</code>	use very small math script style.
<code>\raggedbottom</code>	suppress bottom justification of page text.	<code>*\scriptspace</code>	extra space after subscript or superscript.
<code>\raggedright</code>	suppress right justification of paragraph lines.	<code>*\scriptstyle</code>	use small math script style.
<code>*\raise</code>	raise a box a given distance.	<code>*\scrollmode</code>	process $\TeX$ input without pausing for normal errors.
<code>\rangle</code>	math delimiter: right angle bracket ( $\rangle$ ).	<code>\searrow</code>	math symbol: southeast arrow ( $\searrow$ ).
<code>\rbrace</code>	math delimiter: right curly brace ( $\rbrace$ ).	<code>\sec</code>	math function: secant.
<code>\rbrack</code>	math delimiter: right bracket ( $\rbrack$ ).	<code>*\setbox</code>	store an <code>hbox</code> or <code>vbox</code> in a box register.
<code>\rceil</code>	math delimiter: right ceiling bracket ( $\rceil$ ).	<code>3\setlanguage</code>	specify language to be used for hyphenation.
<code>\Re</code>	math symbol: real, Fraktur R ( $\Re$ ).	<code>\setminus</code>	math operator: set minus ( $\setminus$ ).
<code>*\read</code>	read a line from a file.	<code>\settabs</code>	define horizontal tabs.
<code>*\relax</code>	do nothing.		
<code>\relbar</code>	math symbol: relation bar ( $\relbar$ ).		
<code>\Relbar</code>	math symbol: double relation bar ( $\Relbar$ ).		

<code>\sevenbf</code>	7 point bold Roman font.	<code>\sqrt</code>	square root of a formula.
<code>\seveni</code>	7 point math italic font.	<code>\sqsubseteq</code>	math relation: square subset or equal ( $\sqsubseteq$ ).
<code>\sevenrm</code>	7 point Roman font.	<code>\sqsupseteq</code>	math relation: square superset or equal ( $\sqsupseteq$ ).
<code>\sevensy</code>	7 point math symbol font.	<code>\ss</code>	German letter: sharp s ( $\beta$ ).
<code>*\sfcode</code>	set a character's space factor.	<code>\star</code>	math operator: star ( $\star$ ).
<code>\sharp</code>	math symbol: sharp ( $\sharp$ ).	<code>*\string</code>	expand a control sequence into character tokens.
<code>*\shipout</code>	send a box to the DVI file.	<code>\strut</code>	vertical strut to preserve line spacing.
<code>*\show</code>	show a token.	<code>\strutbox</code>	box containing a strut.
<code>*\showbox</code>	show a box.	<code>\subset</code>	math relation: subset ( $\subset$ ).
<code>*\showboxbreadth</code>	maximum boxed items shown at a given depth.	<code>\subseteq</code>	math relation: subset or equal ( $\subseteq$ ).
<code>*\showboxdepth</code>	maximum box depth shown.	<code>\succ</code>	math relation: successor ( $\succ$ ).
<code>\showhyphens</code>	show hyphenations of given words.	<code>\succeq</code>	math relation: successor or equal ( $\succeq$ ).
<code>*\showlists</code>	show the current lists.	<code>\sum</code>	math operator: large sum ( $\sum$ ).
<code>*\showthe</code>	display the contents of a register.	<code>\sup</code>	math function: sup.
<code>\sigma</code>	math Greek letter: sigma ( $\sigma$ ).	<code>\supereject</code>	flush all insertions and eject to a new page.
<code>\Sigma</code>	math Greek letter: capital sigma ( $\Sigma$ ).	<code>\supset</code>	math relation: superset ( $\supset$ ).
<code>\sim</code>	math relation: similar ( $\sim$ ).	<code>\supseteq</code>	math relation: superset or equal ( $\supseteq$ ).
<code>\simeq</code>	math relation: similar or equal ( $\simeq$ ).	<code>\surd</code>	math symbol: surd ( $\sqrt{\quad}$ ).
<code>\sin</code>	math function: sine.	<code>\swarrow</code>	math symbol: southwest arrow ( $\swarrow$ ).
<code>\sinh</code>	math function: hyperbolic sine.	<code>\t</code>	tie-after accent ( $\text{\o}$ ).
<code>\skew</code>	shift super accents.	<code>\tabalign</code>	begin a tabbed line in an inner environment.
<code>*\skewchar</code>	horizontal kern to position accents.	<code>\tabs</code>	box containing current tabs.
<code>*\skip</code>	use a skip register.	<code>*\tabskip</code>	space between aligned tab entries.
<code>*\skipdef</code>	define a name for a skip register.	<code>\tan</code>	math function: tangent.
<code>\sl</code>	select slanted font.	<code>\tanh</code>	math function: hyperbolic tangent.
<code>\slash</code>	permit a line break after a slash.	<code>\tau</code>	math Greek letter: tau ( $\tau$ ).
<code>\slfam</code>	slanted font family.	<code>\tenbf</code>	10 point bold font.
<code>\smallbreak</code>	small vertical space and a good page break.	<code>\tenex</code>	10 point math extension symbol font.
<code>\smallint</code>	math operator: small integral ( $\int$ ).	<code>\teni</code>	10 point math italic font.
<code>\smallskip</code>	small vertical space.	<code>\tenit</code>	10 point text italic font.
<code>\smallskipamount</code>	<code>\smallskip</code> space.	<code>\tenrm</code>	10 point Roman font.
<code>\smash</code>	create a formula with zero height.	<code>\tensl</code>	10 point slanted font.
<code>\smile</code>	math relation: smile ( $\smile$ ).	<code>\tensy</code>	10 point math symbol font.
<code>\sp</code>	superscript, equivalent to $\wedge$ .	<code>\tentt</code>	10 point typewriter font.
<code>\space</code>	a blank space.	<code>\TeX</code>	"T <sub>E</sub> X" logo.
<code>*\spacefactor</code>	set a character's spacing factor.	<code>*\textfont</code>	select font for non-math text.
<code>*\spaceskip</code>	space between words.	<code>\textindent</code>	display an item without hanging indentation.
<code>\spadesuit</code>	math symbol: spade suit ( $\spadesuit$ ).	<code>*\textstyle</code>	use in-text style for math.
<code>*\span</code>	create a multicolumn entry in an aligned table.	<code>*\the</code>	convert a numeric register to displayable form.
<code>*\special</code>	include balanced text in DVI file for post-processing.	<code>\theta</code>	math Greek letter: theta ( $\theta$ ).
<code>*\splitbotmark</code>	mark text last encountered in a split box.	<code>\Theta</code>	math Greek letter: capital theta ( $\Theta$ ).
<code>*\splitfirstmark</code>	mark text first encountered in a split box.	<code>*\thickmuskip</code>	thick space in math formulas.
<code>*\splitmaxdepth</code>	maximum depth of boxes in a split box.	<code>*\thinmuskip</code>	thin space in math formulas.
<code>*\splittopskip</code>	space at top of a split box.	<code>\thinspace</code>	unbreakable small horizontal space.
<code>\sqcap</code>	math operator: square cap ( $\sqcap$ ).	<code>\tilde</code>	math accent: tilde ( $\tilde{x}$ ).
<code>\sqcup</code>	math operator: square cup ( $\sqcup$ ).	<code>*\time</code>	current time of day.

<code>\times</code>	math operator: times ( $\times$ ).	<code>*\unpenalty</code>	remove a penalty just added to the current list.
<code>\to</code>	math relation: to ( $\rightarrow$ ).	<code>*\unskip</code>	remove a skip just added to the current list.
<code>*\toks</code>	use a token list register.	<code>*\unvbox</code>	un-box a vbox and add it to the vertical list.
<code>*\toksdef</code>	define a name for a token list register.	<code>*\unvcopy</code>	un-box a copy of a vbox and add it to the vertical list.
<code>*\tolerance</code>	badness tolerance after hyphenation.	<code>\uparrow</code>	math delimiter: upward arrow ( $\uparrow$ ).
<code>\top</code>	math symbol: top ( $\top$ ).	<code>\Uparrow</code>	math symbol: upward double arrow ( $\Uparrow$ ).
<code>\topins</code>	insertion class for inserts at the top of a page.	<code>\upbracefill</code>	fill a space with an upward brace.
<code>\topinsert</code>	insert text at the top of the page.	<code>\updownarrow</code>	math delimiter: up-and-down arrow ( $\updownarrow$ ).
<code>*\topmark</code>	value of <code>\botmark</code> just before current page was boxed.	<code>\Updownarrow</code>	math symbol: up-and-down double arrow ( $\Updownarrow$ ).
<code>*\topskip</code>	space at the top of a page.	<code>\uplus</code>	math operator: U plus ( $\uplus$ ).
<code>\tracingall</code>	turn on all debugging commands.	<code>*\uppercase</code>	translate balanced text to upper-case.
<code>*\tracingcommands</code>	show commands before they are executed.	<code>\upsilon</code>	math Greek letter: upsilon ( $\upsilon$ ).
<code>*\tracinglostchars</code>	show characters not in the font.	<code>\Upsilon</code>	math Greek letter: capital upsilon ( $\Upsilon$ ).
<code>*\tracingmacros</code>	show macros as they are expanded.	<code>\v</code>	check accent ( $\check{x}$ ).
<code>*\tracingonline</code>	show diagnostics on the terminal.	<code>*\vadjust</code>	insert vertical material into a paragraph.
<code>*\tracingoutput</code>	show boxes that are shipped out.	<code>*\valign</code>	align zero or more columns.
<code>*\tracingpages</code>	show page-break calculations.	<code>\varepsilon</code>	math Greek letter: variant epsilon ( $\varepsilon$ ).
<code>*\tracingparagraphs</code>	show line-break calculations.	<code>\varphi</code>	math Greek letter: variant phi ( $\varphi$ ).
<code>*\tracingrestores</code>	show unassignments when groups end.	<code>\varpi</code>	math Greek letter: variant pi ( $\varpi$ ).
<code>*\tracingstats</code>	show statistics about memory usage.	<code>\varrho</code>	math Greek letter: variant rho ( $\varrho$ ).
<code>\triangle</code>	math symbol: triangle ( $\triangle$ ).	<code>\varsigma</code>	math Greek letter: variant sigma ( $\varsigma$ ).
<code>\triangleleft</code>	math operator: left triangle ( $\triangleleft$ ).	<code>\vartheta</code>	math Greek letter: variant theta ( $\vartheta$ ).
<code>\triangleright</code>	math operator: right triangle ( $\triangleright$ ).	<code>*\vbadness</code>	limit for bad vbox errors.
<code>\tt</code>	select typewriter font.	<code>*\vbox</code>	create a box with vertical mode material.
<code>\ttfam</code>	typewriter font family.	<code>*\vcenter</code>	create a centered vbox in a math list.
<code>\ttraggedright</code>	suppress right justification of typewriter font lines.	<code>\vdash</code>	math relation: dash ( $\vdash$ ).
<code>\u</code>	breve accent ( $\check{x}$ ).	<code>\vdots</code>	math symbol: vertical dots ( $\vdots$ ).
<code>*\uccode</code>	upper-case code for a character.	<code>\vec</code>	math accent: vector ( $\vec{x}$ ).
<code>*\uchyph</code>	positive if hyphenating words beginning with capital letters.	<code>\vee</code>	math binary operator: join or V ( $\vee$ ).
<code>\undefined</code>	an undefined control sequence.	<code>\vert</code>	math delimiter: vertical bar ( $ $ ).
<code>\underbar</code>	create a box with an underline.	<code>\Vert</code>	math delimiter: double vertical bar ( $  $ ).
<code>\underbrace</code>	horizontal brace under a math formula.	<code>*\vfil</code>	infinitely stretchable vertical space.
<code>*\underline</code>	draw a line under a formula.	<code>*\vfill</code>	more infinitely stretchable vertical space.
<code>*\unhbox</code>	un-box an hbox and add it to the horizontal list.	<code>*\vfilneg</code>	cancel infinitely stretchable vertical space.
<code>*\unhcopy</code>	un-box a copy of an hbox and add it to the horizontal list.	<code>\vfootnote</code>	place a footnote in a caption or other vertical list.
<code>*\unkern</code>	remove a kern just added to the current list.	<code>*\vfuzz</code>	maximum overrun before overfull vbox error.

<code>\vglue</code>	create some vertical space.
<code>*\voffset</code>	vertical offset of a page.
<code>\vphantom</code>	create a zero-width vbox the height and depth of a formula.
<code>*\vrule</code>	produce a vertical rule.
<code>*\vsize</code>	height of text on a page or <code>\vbox</code> .
<code>*\vskip</code>	add vertical space.
<code>*\vsplit</code>	split off a specified amount from a vbox.
<code>*\vss</code>	infinitely stretchable and shrinkable vertical space.
<code>*\vtop</code>	create a box with vertical mode material with the baseline at the top.
<code>*\wd</code>	width of a box.
<code>\wedge</code>	math binary operator: operator ( $\wedge$ ).
<code>\widehat</code>	math accent: wide hat ( $\widehat{x}$ ).
<code>\widetilde</code>	math accent: wide tilde ( $\widetilde{x}$ ).
<code>*\widowpenalty</code>	penalty for creating a widow line at top of page.
<code>\wlog</code>	write to the log file only.
<code>\wp</code>	math symbol: Weierstrass p ( $\wp$ ).
<code>\wr</code>	math binary operator: wreath product ( $\wr$ ).
<code>*\write</code>	write a token list to a file.
<code>*\xdef</code>	define a global macro with expanded replacement text.
<code>\xi</code>	math Greek letter: xi ( $\xi$ ).
<code>\Xi</code>	math Greek letter: capital xi ( $\Xi$ ).
<code>*\xleaders</code>	fill a space with an evenly distributed box or rule.
<code>*\xspaceskip</code>	space between sentences.
<code>*\year</code>	current year of our Lord.
<code>\zeta</code>	math Greek letter: zeta ( $\zeta$ ).

Number of T<sub>E</sub>X primitives and commands: 864.

## Chapter 4

# L<sup>A</sup>T<sub>E</sub>X Commands

<code>\'</code>	put text flush right in a column in tabbing environment.	<code>\and</code>	additional authors on title page.
<code>\(</code>	begin math mode.	<code>\appendix</code>	set sectional units to appendix style.
<code>\)</code>	end math mode.	<code>\arabic</code>	display counter as Arabic numerals.
<code>\-</code>	unindents left margin one tab stop in tabbing environment.	<code>\array</code>	begin array environment.
<code>\:</code>	medium space in math mode.	<code>\arraycolsep</code>	column separation in array environment.
<code>\&lt;</code>	cancel effect of one <code>\+</code> command in tabbing environment.	<code>\arrayrulewidth</code>	set width of array rules.
<code>\=</code>	define a tab stop in tabbing environment.	<code>\arraystretch</code>	space between rows of array or tabular environment.
<code>\&gt;</code>	move to next tab position in tabbing environment.	<code>\author</code>	title page author.
<code>\@</code>	create end-of-sentence space after following punctuation.	<code>\baselinestretch</code>	multiple of normal <code>\baselineskip</code> .
<code>\[</code>	begin display math mode.	<code>\begin</code>	beginning of an environment.
<code>\]</code>	force a line break in a paragraph.	<code>\bf</code>	bold font style.
<code>\]</code>	end display math mode.	<code>\bibitem</code>	create a bibliography entry.
<code>\+</code>	indents left margin one tab stop in tabbing environment.	<code>\bibliography</code>	enable BIB <sub>T</sub> E <sub>X</sub> bibliography interface.
<code>\@@par</code>	T <sub>E</sub> X primitive <code>\par</code> .	<code>\bibliographystyle</code>	specify bibliographic style for BIB <sub>T</sub> E <sub>X</sub> .
<code>\@beginparpenalty</code>	penalty at the beginning of a list.	<code>\big</code>	big font size.
<code>\@endparpenalty</code>	penalty at the end of a list.	<code>\Big</code>	bigger font size.
<code>\@hangfrom</code>	hanging indent of a paragraph.	<code>\BIG</code>	biggest font size.
<code>\@ifnextchar</code>	test the next character.	<code>\bigskip</code>	vertical skip a large amount.
<code>\@itempenalty</code>	penalty between list items.	<code>\boldmath</code>	select bold math italic and symbol fonts.
<code>\a</code>	produce T <sub>E</sub> X accents in tabbing environment.	<code>\botfigrule</code>	place rule between text and bottom floats.
<code>\addcontentsline</code>	adds an entry to the specified list or table.	<code>\bottomfraction</code>	fraction of column for bottom floats.
<code>\addtocontents</code>	add text to table contents, figures, or tables.	<code>\Box</code>	math symbol: box (□).
<code>\addtocounter</code>	increment a counter.	<code>\caption</code>	produce a numbered caption.
<code>\addtolength</code>	increment the value of a length command.	<code>\center</code>	begin centering environment.
<code>\addvspace</code>	add extra vertical space.	<code>\centering</code>	declaration to center lines.
<code>\alph</code>	display counter as lower-case letter.	<code>\chapter</code>	start a chapter.
<code>\Alph</code>	display counter as upper-case letter.	<code>\circle</code>	circle in a picture environment.
		<code>\cite</code>	generate an in-text citation of a reference.
		<code>\cleardoublepage</code>	flush figures and tables and start a new right-hand page.

<code>\clearpage</code>	flush figures and start a new page.	<code>\equation</code>	begin and cross reference an equation.
<code>\cline</code>	multicolumn line in array or tabular environment.	<code>\evensidemargin</code>	left hand margin on even pages.
<code>\columnsep</code>	space between columns in double column text.	<code>\extracolsep</code>	add extra space before a column in array or tabular environment.
<code>\columnseprule</code>	width of rule separating double columns.	<code>\fbox</code>	create and frame a box.
<code>\columnwidth</code>	width of a column.	<code>\fboxrule</code>	thickness of rule surrounding framed box.
<code>\dashbox</code>	create a box in dashes, with positioning.	<code>\fboxsep</code>	space between a box and its contents in <code>\fbox</code> and <code>\framebox</code> .
<code>\date</code>	date on title page.	<code>\figure</code>	begin a floating figure.
<code>\dblfigrule</code>	rule between double-column floats and text.	<code>\fill</code>	an unoriented skip amount with stretch of <code>1fill</code> .
<code>\dblfloatpagefraction</code>	size of float on double-column page.	<code>\fivly</code>	5 point L <sup>A</sup> T <sub>E</sub> X symbol font.
<code>\dblfloatsep</code>	space between double-column floats.	<code>\fivmi</code>	5 point math italic font.
<code>\dbltextfloatsep</code>	space between double-column floats and text.	<code>\fivrm</code>	5 point Roman font.
<code>\dbltopfraction</code>	fraction of two-column page for top floats.	<code>\fivsy</code>	5 point math symbol font.
<code>\Diamond</code>	math symbol: diamond (◊).	<code>\floatpagefraction</code>	portion of page that may be occupied by floats.
<code>\document</code>	read in the .AUX files and disable alpha @ processing.	<code>\floatsep</code>	space between floats.
<code>\documentstyle</code>	declare document style and options.	<code>\flushbottom</code>	justify page bottoms to the same height.
<code>\doublerulesep</code>	double rule separation in array or tabular environment.	<code>\flushleft</code>	begin flush left environment.
<code>\egtit</code>	8 point italic font.	<code>\flushright</code>	begin flush right environment.
<code>\egtly</code>	8 point L <sup>A</sup> T <sub>E</sub> X symbol font.	<code>\fnsymbol</code>	display counter as footnote symbol.
<code>\egtmi</code>	8 point math italic font.	<code>\footheight</code>	height of page footer.
<code>\egtrm</code>	8 point Roman font.	<code>\footins</code>	space between main text and footnotes.
<code>\egtsy</code>	8 point math symbol font.	<code>\footnotemark</code>	insert a footnote mark without text.
<code>\elvbf</code>	11 point bold extended font.	<code>\footnoterule</code>	macro to draw the rule separating footnotes from text.
<code>\elvit</code>	11 point italic font.	<code>\footnotesep</code>	footnote separation distance.
<code>\elvly</code>	11 point L <sup>A</sup> T <sub>E</sub> X symbol font.	<code>\footnotesize</code>	select footnote font size.
<code>\elvmi</code>	11 point math italic font.	<code>\footnotetext</code>	produce footnote text without a mark.
<code>\elvrm</code>	11 point Roman font.	<code>\footskip</code>	space between text and page footer.
<code>\elvsf</code>	11 point sans serif font.	<code>\frac</code>	generate a fraction.
<code>\elvsl</code>	11 point slanted font.	<code>\frame</code>	put a frame around some text.
<code>\elvsv</code>	11 point math symbol font.	<code>\framebox</code>	create and frame a box, with positioning.
<code>\elvttt</code>	11 point typewriter font.	<code>\frtnbf</code>	14 point bold extended font.
<code>\em</code>	emphasis font.	<code>\frtnly</code>	14 point L <sup>A</sup> T <sub>E</sub> X symbol font.
<code>\end</code>	end of an environment.	<code>\frtnmi</code>	14 point math italic font.
<code>\endarray</code>	end array environment.	<code>\frtnrm</code>	14 point Roman font.
<code>\endcenter</code>	end centering environment.	<code>\frtnsv</code>	14 point math symbol font.
<code>\endequation</code>	end an equation.	<code>\fussy</code>	require strict line and page breaks.
<code>\endfigure</code>	end a floating figure.	<code>\glossary</code>	write a glossary entry.
<code>\endflushleft</code>	end flush left environment.	<code>\headheight</code>	height of page header.
<code>\endflushright</code>	end flush right environment.	<code>\headsep</code>	space between page header and text.
<code>\endpicture</code>	end picture environment.	<code>\hline</code>	horizontal line in array and tabular environments.
<code>\endthebibliography</code>	end bibliography environment.	<code>\hspace</code>	skip horizontal space.

<code>\huge</code>	select font four steps larger than normal size.	<code>\leftmarginvi</code>	width of left margin in sixth-level list.
<code>\Huge</code>	select largest available font.	<code>\leftmark</code>	produces current left page heading.
<code>\include</code>	read a file unless disabled by <code>\includeonly</code> .	<code>\lhd</code>	math symbol: left half diamond ( $\triangleleft$ ).
<code>\includeonly</code>	enable only specific <code>\include</code> commands.	<code>\line</code>	line in a picture environment.
<code>\index</code>	create an index entry.	<code>\linebreak</code>	encourage a line break.
<code>\indexentry</code>	an entry in a file of index terms.	<code>\linethickness</code>	set width of lines in picture environment.
<code>\indexspace</code>	amount of extra space between entries in an index.	<code>\linewidth</code>	width of the current line.
<code>\interfootnotelinepenalty</code>	interline penalty for footnotes.	<code>\listoffigures</code>	generate a list of figures.
<code>\intertextsep</code>	vertical space around a float in the middle of a page.	<code>\listoftables</code>	generate a list of tables.
<code>\item</code>	start an entry in a list environment.	<code>\listparindent</code>	indent second and subsequent paragraphs in a list environment.
<code>\itemindent</code>	indent before the label in a list environment.	<code>\load</code>	load a font.
<code>\itemsep</code>	space between successive items in a list environment.	<code>\makeatletter</code>	set @ alphabetic to access internal commands.
<code>\Join</code>	math symbol: join ( $\bowtie$ ).	<code>\makeatother</code>	set @ non-alphabetic to hide internal commands.
<code>\kill</code>	discard current line in tabbing environment.	<code>\makebox</code>	create a box, with positioning.
<code>\label</code>	define a cross reference label.	<code>\makeglossary</code>	enable glossary processing.
<code>\labelitemi</code>	mark denoting first-level items.	<code>\makeindex</code>	enable index creation.
<code>\labelitemii</code>	mark denoting second-level items.	<code>\makelabel</code>	create item label for a list environment.
<code>\labelitemiii</code>	mark denoting third-level items.	<code>\maketitle</code>	produce the title.
<code>\labelitemiv</code>	mark denoting fourth-level items.	<code>\marginpar</code>	produce a marginal note.
<code>\labelitemv</code>	mark denoting fifth-level items.	<code>\marginparpush</code>	vertical space between marginal notes.
<code>\labelitemvi</code>	mark denoting sixth-level items.	<code>\marginparsep</code>	distance between marginal note and text.
<code>\labelsep</code>	space between a label and text of a list item.	<code>\marginparwidth</code>	width of marginal notes.
<code>\labelwidth</code>	label width in a list environment.	<code>\markboth</code>	set headings for left and right pages.
<code>\large</code>	select font one step larger than normal size.	<code>\markright</code>	set heading for right pages.
<code>\Large</code>	select font two steps larger than normal size.	<code>\mathindent</code>	indentation of display equations.
<code>\LARGE</code>	select font three steps larger than normal size.	<code>\mbox</code>	create a box.
<code>\LaTeX</code>	L <sup>A</sup> T <sub>E</sub> X logo.	<code>\medskip</code>	vertical skip a medium amount.
<code>\leadsto</code>	math symbol: leads to ( $\rightsquigarrow$ ).	<code>\mho</code>	math symbol: mho ( $\Omega$ ).
<code>\lefteqn</code>	set a formula flush left in display style.	<code>\minipage</code>	create a small sample page.
<code>\leftmargin</code>	left margin of a list environment.	<code>\multicolumn</code>	multicolumn entry in array or tabular environment.
<code>\leftmargini</code>	width of left margin in first-level list.	<code>\multipt</code>	place several copies of a picture object.
<code>\leftmarginii</code>	width of left margin in second-level list.	<code>\newcommand</code>	define a new command.
<code>\leftmarginiii</code>	width of left margin in third-level list.	<code>\newcounter</code>	define a new counter variable.
<code>\leftmarginiv</code>	width of left margin in fourth-level list.	<code>\newenvironment</code>	define a new environment.
<code>\leftmarginv</code>	width of left margin in fifth-level list.	<code>\newfont</code>	select a font.
		<code>\newlength</code>	define a new length command.
		<code>\newline</code>	force a line break in a paragraph.
		<code>\newpage</code>	start a new page.
		<code>\newsavebox</code>	define a new box register.
		<code>\newtheorem</code>	define a new theorem environment.
		<code>\ninbf</code>	9 point bold extended font.
		<code>\ninit</code>	9 point italic font.
		<code>\ninly</code>	9 point L <sup>A</sup> T <sub>E</sub> X symbol font.

<code>\ninmi</code>	9 point math italic font.	<code>\restorecr</code>	restores a carriage return to its usual meaning.
<code>\ninrm</code>	9 point Roman font.	<code>\reversemarginpar</code>	put marginal notes on opposite side of page.
<code>\ninsy</code>	9 point math symbol font.	<code>\rhd</code>	math symbol: right half diamond ( $\triangleright$ ).
<code>\nintt</code>	9 point typewriter font.	<code>\rightmargin</code>	right margin in a list.
<code>\nocite</code>	reference a BIB <sub>T</sub> E <sub>X</sub> item without citation.	<code>\rightmark</code>	produces current right page heading.
<code>\nofiles</code>	suppress writing all auxiliary files.	<code>\roman</code>	display counter as lower-case Roman numerals.
<code>\nolinebreak</code>	suppress a line break.	<code>\Roman</code>	display counter as upper-case Roman numerals.
<code>\nonumber</code>	suppress numbering of displayed equations.	<code>\rule</code>	create a rule or line.
<code>\nopagebreak</code>	suppress a page break.	<code>\samepage</code>	inhibit a page break over a region.
<code>\normalmarginpar</code>	put marginal notes on default side of page.	<code>\savebox</code>	create and name a box, with positioning.
<code>\normalsize</code>	select normal font size.	<code>\sbox</code>	create and name a box.
<code>\numberline</code>	includes the section number in a <code>\contentsline</code> command.	<code>\sc</code>	select small caps font.
<code>\obeycr</code>	defines a carriage return as <code>\</code> .	<code>\scriptscriptsize</code>	select sub-subscript font size.
<code>\oddsidemargin</code>	left hand margin on odd pages.	<code>\scriptsize</code>	select subscript or superscript font size.
<code>\onecolumn</code>	start a new page in single-column format.	<code>\section</code>	start a section.
<code>\oval</code>	oval in a picture environment.	<code>\setcounter</code>	set value of a counter.
<code>\pagebreak</code>	encourage a page break.	<code>\setlength</code>	set a length command.
<code>\pagenumbering</code>	specify page numbering style.	<code>\settowidth</code>	set a length command to width of text.
<code>\pageref</code>	page number of a cross reference label.	<code>\sevit</code>	7 point italic font.
<code>\pagestyle</code>	set global page style.	<code>\sevly</code>	7 point L <sup>A</sup> T <sub>E</sub> X symbol font.
<code>\paragraph</code>	start a labeled paragraph.	<code>\sevmi</code>	7 point math italic font.
<code>\parbox</code>	put a paragraph in a box.	<code>\sevrn</code>	7 point Roman font.
<code>\parsep</code>	space between paragraphs within an item in a list environment.	<code>\sevsy</code>	7 point math symbol font.
<code>\part</code>	start a major division of a long document.	<code>\sf</code>	select sans serif font.
<code>\partopsep</code>	extra vertical space when environment starts a paragraph.	<code>\shortstack</code>	create a box with a single column of items.
<code>\picture</code>	begin picture environment.	<code>\showoutput</code>	trace output processing.
<code>\poptabs</code>	restore tabs stops in tabbing environment.	<code>\sixly</code>	6 point L <sup>A</sup> T <sub>E</sub> X symbol font.
<code>\pounds</code>	British pound symbol (£).	<code>\sixmi</code>	6 point math italic font.
<code>\protect</code>	protect fragile commands and moving arguments.	<code>\sixrm</code>	6 point Roman font.
<code>\pushtabs</code>	save current tab stops in tabbing environment.	<code>\sixsy</code>	6 point math symbol font.
<code>\put</code>	place a picture object.	<code>\sloppy</code>	accept looser line and page breaks.
<code>\raggedbottom</code>	justify page bottoms to their natural height.	<code>\small</code>	select small font size.
<code>\raggedleft</code>	flush lines right.	<code>\smallskip</code>	vertical skip a small amount.
<code>\raggedright</code>	flush lines left.	<code>\sqsubset</code>	math symbol: square subset ( $\sqsubset$ ).
<code>\raisebox</code>	raise a box a distance.	<code>\sqsupset</code>	math symbol: square superset ( $\sqsupset$ ).
<code>\ref</code>	refer to a cross reference label.	<code>\stackrel</code>	stack one equation above another.
<code>\refstepcounter</code>	increment and reference a counter.	<code>\stepcounter</code>	increment a counter.
<code>\renewcommand</code>	redefine a command.	<code>\stop</code>	terminate L <sup>A</sup> T <sub>E</sub> X and flush the final page.
<code>\renewenvironment</code>	redefine an environment.	<code>\stretch</code>	infinitely stretchable space.
		<code>\subitem</code>	second-level item in an index.
		<code>\subparagraph</code>	start a labeled sub-level paragraph.
		<code>\subsection</code>	start a subsection.
		<code>\subsubitem</code>	third-level item in an index.

<code>\subsubsection</code>	start a subsection.	<code>\topsep</code>	space between first list item and preceding paragraph.
<code>\svtnbf</code>	17 point bold extended font.	<code>\twlbf</code>	12 point bold extended font.
<code>\svtnly</code>	17 point L <sup>A</sup> T <sub>E</sub> X symbol font.	<code>\twlit</code>	12 point italic font.
<code>\svtnmi</code>	17 point math italic font.	<code>\twlly</code>	12 point L <sup>A</sup> T <sub>E</sub> X symbol font.
<code>\svtnrm</code>	17 point Roman font.	<code>\twlmi</code>	12 point math italic font.
<code>\svtnsy</code>	17 point math symbol font.	<code>\twlrm</code>	12 point Roman font.
<code>\symbol</code>	display a symbol from a font.	<code>\twlsf</code>	12 point sans serif font.
<code>\tabbingsep</code>	distance left by <code>\'</code> command between tabbing fields.	<code>\twlsl</code>	12 point slanted font.
<code>\tabcolsep</code>	half the width separating columns in a tabular environment.	<code>\twlsy</code>	12 point math symbol font.
<code>\tableofcontents</code>	generate a table of contents.	<code>\twlts</code>	12 point typewriter font.
<code>\tencirc</code>	10 point circle font.	<code>\twocolumn</code>	start a new page in double-column format.
<code>\tencircw</code>	10 point wide circle font.	<code>\twtybf</code>	20 point bold extended font.
<code>\tenln</code>	10 point line font.	<code>\twtyly</code>	20 point L <sup>A</sup> T <sub>E</sub> X symbol font.
<code>\tenlnw</code>	10 point wide line font.	<code>\twtymi</code>	20 point math italic font.
<code>\tenly</code>	10 point L <sup>A</sup> T <sub>E</sub> X symbol font.	<code>\twtyrm</code>	20 point Roman font.
<code>\tenmi</code>	10 point math italic font.	<code>\twtysy</code>	20 point math symbol font.
<code>\tensf</code>	10 point sans serif font.	<code>\typein</code>	execute a command from the terminal.
<code>\textfloatsep</code>	space between floats and the text.	<code>\typeout</code>	write a message on the terminal.
<code>\textfraction</code>	size of column that must contain text.	<code>\unboldmath</code>	unselect bold math italic and symbol fonts.
<code>\textheight</code>	height of text, excluding head and foot.	<code>\underline</code>	create an underlined box with text in it.
<code>\textwidth</code>	width of printing on page.	<code>\unitlength</code>	unit of distance in picture environment.
<code>\thanks</code>	add footnote to title page.	<code>\unlhd</code>	math symbol: underlined left half diamond ( $\leq$ ).
<code>\theenumi</code>	current value of the first-level item counter.	<code>\unrhd</code>	math symbol: underlined right half diamond ( $\geq$ ).
<code>\theenumii</code>	current value of the second-level item counter.	<code>\usebox</code>	use a named box.
<code>\theenumiii</code>	current value of the third-level item counter.	<code>\usecounter</code>	associate a counter with an item-type command.
<code>\theenumiv</code>	current value of the fourth-level item counter.	<code>\value</code>	produce the value of a counter.
<code>\theenumv</code>	current value of the fifth-level item counter.	<code>\vector</code>	vector in a picture environment.
<code>\theenumvi</code>	current value of the sixth-level item counter.	<code>\verb</code>	generate a short amount of verbatim text.
<code>\theequation</code>	number of the current displayed equation.	<code>\vline</code>	vertical line in array and tabular environments.
<code>\thefigure</code>	current value of the figure counter.	<code>\vspace</code>	skip vertical space.
<code>\thefootnote</code>	produces the footnote number.		
<code>\thepage</code>	current page number.		
<code>\thicklines</code>	thick lines for lines and circles.		
<code>\thinlines</code>	thin lines for lines and circles.		
<code>\thispagestyle</code>	set current page style.		
<code>\tiny</code>	select smallest defined font.		
<code>\title</code>	declare the title.		
<code>\today</code>	display today's date.		
<code>\topfigrule</code>	place rule between top floats and text.		
<code>\topfraction</code>	fraction of column for top floats.		
<code>\topmargin</code>	extra space added to top of page.		

Number of L<sup>A</sup>T<sub>E</sub>X commands: 367.
